1 Banach space theory

1.1 Quotient spaces, Baire category and uniform boundedness

Theorem. Let $\|\cdot\|$ be a **seminorm** on a vector space V. If we define $E = \{v \in V : \|v\| = 0\}$, then E is a subspace of V, and the function on V/E defined by

$$\|v + E\| = \|v\|$$

for any $v + E \in V/E$ defines a **norm**.

Theorem (Baire Category Theorem)**.** Let M be a complete metric space, and let $\{C_n\}_{n=0}^{\infty}$ be a collection of closed subsets of M such that $M = \bigcup_{n=0}^{\infty} C_n$. Then at least one of the C_n contains an open ball $B(x, r) = \{y \in M : d(x, y) < r\}$.

Theorem (Uniform Boundedness Theorem)**.** Let B be Banach space and V a normed vector space. Let $\{T_n\}_{n=0}^{\infty}$ be a sequence in $\mathcal{B}(B, V)$. Then if for all $b \in B$ we have $\sup_n \|T_n b\| < \infty$ (that is, this sequence is pointwise boudned), then $\sup_n \|T_n\| < \infty$ (the operator norms are bounded).

Proof. For each $k \in \mathbb{N}$, define

$$C_k = \left\{ b \in B : \|b\| \leq 1, \sup_{n \in \mathbb{N}} \|T_n b\| \leq k \right\}.$$

This set is closed for each $k \in \mathbb{N}$, but by assumption, we have

$$\{b \in B : \|b\| \leq 1\} = \bigcup_{k=0}^{\infty} C_k.$$

The left hand side is a closed subset of B, and is thus a complete metric space. By Baire Category Theorem, there exists $k \in \mathbb{N}$ such that C_k contains an open ball $B(b_0, \delta_0)$. Then, if $b \in B(0, \delta_0)$, we have $b_0 + b \in B(b_0, \delta_0)$ and thus

$$\sup_{n \in \mathbb{N}} \|T_n(b_0 + b)\| \leq k.$$

It follows that

$$\sup_{n \in \mathbb{N}} \|T_n b\| \leq \sup_{n \in \mathbb{N}} \|T_n(b_0 + b)\| + \sup_{n \in \mathbb{N}} \|T_n b_0\| \leq 2k.$$

Suppose $\|b\| = 1$, then $\frac{\delta_0}{2} b \in B(0, \delta_0)$ and thus for all $n \in \mathbb{N}$, we have

$$\left\| T_n \left(\frac{\delta_0}{2} b \right) \right\| \leq 2k.$$

Therefore,

$$\sup_{n \in \mathbb{N}} \|T_n\| \leq \frac{4k}{\delta_0}.$$

2 Hilbert space theory

2.1 Basic Hilbert space theory

Definition (Pre-Hilbert space)**.** A **pre-Hilbert** space H is a vector space over $\mathbb{C}$ with a **Hermitian inner product**, which is a map $\langle \cdot, \cdot \rangle : H \times H \to \mathbb{C}$ satisfying the following properties.

1. For all $\lambda_1, \lambda_2 \in C$ and $v_1, v_2, w \in H$, we have
$$\langle \lambda_1 v_1 + \lambda_2 v_2, w \rangle = \lambda_1 \langle v_1, 2 \rangle + \lambda_2 \langle v_2, w \rangle .$$
2. For all $v, w \in H$, we have $\langle v, w \rangle = \overline{\langle w, v \rangle}$.
3. For all $v \in H$, we have $\langle v, v \rangle \geq 0$, with equality if and only if $v = 0$.

Definition. Let H be a pre-Hilbert space. For all $v \in H$, we define
$$\|v\| = \langle v, v \rangle^{\frac{1}{2}} .$$

Theorem (Cauchy-Schwarz inequality)**.** Let H be a pre-Hilbert space. For all $u, v \in H$, we have
$$|\langle u, v \rangle| \leq \|u\| \|v\| .$$

Proof. Define $f(t) = \|u + tv\|^2$. Notice that
$$\begin{aligned} f(t) &= \langle u + tv, u + tv \rangle \\ &= \langle u, u \rangle + t^2 \langle v, v \rangle + t \langle u, v \rangle + t \langle v, u \rangle \\ &= \|u\|^2 + t^2 \|v\|^2 + 2t \operatorname{Re}(\langle u, v \rangle). \end{aligned}$$

This implies that
$$0 \leq f(t_{\min}) = \|u\|^2 - \frac{\operatorname{Re}(\langle u, v \rangle)^2}{\|v\|^2}.$$

It follows that
$$|\operatorname{Re}(\langle u, v \rangle)| \leq \|u\| \|v\| .$$

This is almost what we want. To finish up, first note that if $\langle u, v \rangle = 0$ then there is nothing to prove, so suppose $\langle u, v \rangle \neq 0$, and define
$$\lambda = \frac{\overline{\langle u, v \rangle}}{|\langle u, v \rangle|}.$$

Note that we have $|\lambda| = 1$ and we have the chain of equalities of real numbers:
$$|\langle u, v \rangle| = \lambda \langle u, v \rangle = \langle \lambda u, v \rangle = \operatorname{Re} \langle \lambda u, v \rangle \leq \|\lambda u\| \|v\| .$$

However, $\|\lambda u\| = \|u\|$, so the proof is complete.
